# Coronavirus [COVID-19]: the severity of diagnosed cases in China

Descriptions of 44,415 confirmed cases of COVID-19 nationwide in China.

Included are confirmed cases in the early period of the outbreak of the disease up to February 11, 2020.

## 2.3% of all cases died

1,023 of the 44,415 infected people, for which the breakdown is shown on the right, died.

The case fatality rate is therefore 2.3%.

## 5% Critical cases

Critical cases include patients who suffered respiratory failure, septic shock, and/or multiple organ dysfunction/failure.

## 14% Severe cases

Severe cases include patients suffer from shortness of breath, respiratory frequency  $\geq 30$ /minute, blood oxygen saturation  $\leq 93\%$ , PaO<sub>2</sub>/FiO<sub>2</sub> ratio  $< 300$ , and/or lung infiltrates  $> 50\%$  within 24–48 hours.

## 81% Mild cases

Mild cases include all patients without pneumonia or cases of mild pneumonia.

Cases that were not identified and not diagnosed

Data source: Novel Coronavirus Pneumonia Emergency Response Epidemiology Team. Vital surveillances: the epidemiological characteristics of an outbreak of 2019 novel coronavirus diseases (COVID-19)—China, 2020. China CDC Weekly. Case counts: 36,160 mild cases; 6,168 severe cases; 2,087 critical cases.

## 2020 coronavirus cases in China (NHC)

## Following recommendations will:

- Reduce illnesses
- Reduce deaths
- Keep our medical services more available for those in need
- Buy some time for a 2020 vaccine

## Flattening the curve

# The Exponential Power of Now

The explosive spread of coronavirus can be turned to our advantage, two infectious disease experts argue: "But only if we intervene early. That means now."

cases in the U.S. by date:

- Jan. 14 — 0
- Jan. 21 — 1
- Jan. 28 — 5
- Feb. 4 — 11
- Feb. 11 — 14
- Feb. 18 — 25
- Feb. 25 — 59
- Mar. 3 — 125
- Mar. 10 — 1,004

"That is exponential growth," Dr. Nick Jewell said.

# The symptoms of coronavirus disease [COVID-19]

The most common signs and symptoms of 55,924 laboratory confirmed cases of COVID-19. Reported from China in the period up to February 22, 2020

Our World  
in Data

Many of the most common symptoms are shared with those of the flu or cold. So it is also good to know which common symptoms of the flu or the common cold are not symptoms of COVID-19. COVID-19 infection seems to **rarely cause a runny nose.**

Data source: World Health Organization (2020). Report of the WHO-China Joint Mission on Coronavirus Disease 2019 (COVID-19). Symptoms in fewer than 1% are not shown. OurWorldinData.org - Research and data to make progress against the world's largest problems. Licensed under CC-BY by the authors.

# About COVID-19

This is a new virus, so our bodies have not built up an immunity to it.

COVID-19 seems to result in a 5+x more likelihood of death with older people than a typical case of our historical seasonal flu.

There is currently no vaccine available for COVID-19

In serious cases, COVID-19 may lead to developed acute respiratory distress syndrome (ARDS), pneumonia or death.

Persons with underlying health conditions, may have 5-18% higher risk of death if COVID-19 is contracted. The older we are, the higher chances of death with COVID-19.

Some sources indicate high amounts of virus are shed into the environment, especially early on, such as during the first 7 days of having symptoms.

A person can sometimes have the virus and spread virus before realizing they are ill.

Side Note: The [CDC estimates](#) that, on average, about 8% of the U.S. population gets sick with the flu each season. In 2018, the CDC estimated, there were 80,000 flu deaths.

# Coronavirus: early-stage case fatality rates by underlying health condition in China

Our World  
in Data

Case fatality rate (CFR) is calculated by dividing the total number of deaths from a disease by the number of confirmed cases. Data is based on early-stage analysis of the COVID-19 outbreak in China in the period up to February 11, 2020.

Data source: Novel Coronavirus Pneumonia Emergency Response Epidemiology Team. *Vital surveillances: the epidemiological characteristics of an outbreak of 2019 novel coronavirus diseases (COVID-19)—China, 2020*. China CDC Weekly.

OurWorldinData.org - Research and data to make progress against the world's largest problems.

## What type of underlying health conditions are a factor?

China CDC's analysis of 44,672 patients found that the fatality rate in patients who reported no other health conditions was 0.9%.

The mortality rates were much higher with these conditions:

- 10.5% for those with cardiovascular disease,
- 7.3% for those with diabetes,
- 6.3% for people with chronic respiratory diseases (such as COPD), 6.0% for people with hypertension, and
- 5.6% for those with cancer.
- 16% for patients on dialysis had fatality rate of 16% (from kidney failure, instead of pneumonia) – this was from a smaller study.

Having multiple underlying health issues (Co-morbidities) raise the risk of dying from Covid-19.

About 60% of U.S. adults have at least one underlying health condition, (Tom Frieden, former director of the U.S. Centers for Disease Control and Prevention)

## Covid-19's case fatality rate increases with age, according to China's data

Estimated case fatality risk in Hubei, China, January-February 2020

### Case fatality ratio\*

\*Among all symptomatic and asymptomatic infections

Source: *Adjusted age-specific case fatality ratio during the Covid-19 epidemic in Hubei, China, January and February 2020*, medRxiv

**Vox**

Christina Animashaun/Vox

**As we age, our immune systems become less robust and effective.**

# Case fatality rates: COVID-19 vs. US Seasonal Flu

Case fatality rate (CFR) is specific to a location and time. It is calculated by dividing the total number of deaths from a disease by the number of confirmed cases.

## Seasonal Flu

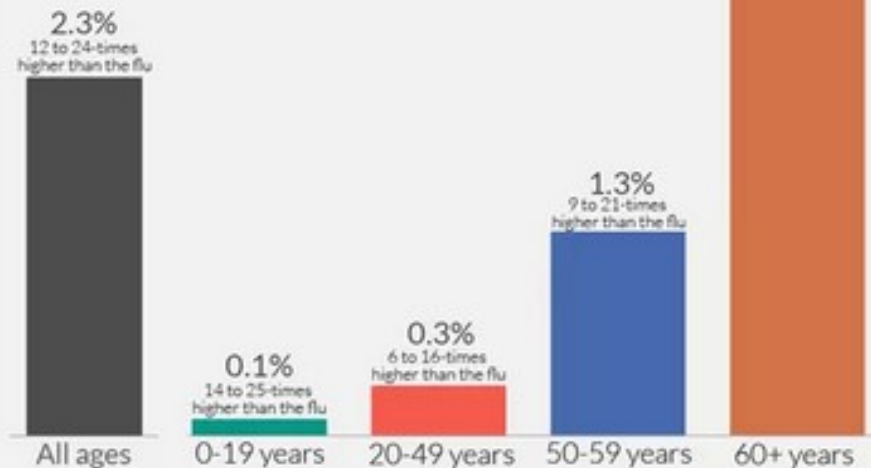

Case fatality rates for the influenza season 2018-19 in the USA.

Symptomatic cases are calculated based on models which aim to account for underreporting – figures based on medical visits are therefore also shown in square brackets, which may be a closer comparison to COVID-19 case fatality rates.

## COVID-19

Case fatality rates for the COVID-19 outbreak in China, for the period up to February 11, 2020.

Data: Novel Coronavirus Pneumonia Emergency Response Epidemiology Team. Vital surveillances: the epidemiological characteristics of an outbreak of 2019 novel coronavirus diseases (COVID-19)—China, 2020. China CDC Weekly. US Influenza data is sourced from the US Centers for Disease Control and Prevention (CDC).

ESTIMATED INDIVIDUALS INFECTED:  
**159,086**  
 by Apr. 30

## How Widespread Will this be in the US??

Model is predicting Cases in the US On April 30, Depending on how well we control spread of the virus

ESTIMATED INDIVIDUALS INFECTED:

CORONAVIRUS ↻

# Trump declares a national emergency

3/13/2020

Americans will soon have a screening website to determine if you should be tested (national capacity 20,000/day)

There will be drive through testing at some Walmart and Target parking lots in every city across the country. People will have access to results on-line next day.
